1. Introduction

1. Introduction

Este documento - Plan de Acción O4.1 para la alineación de las IES con la especialización inteligente regional - se desarrolló como parte de WP4 - Cambios estratégicos en las IES para alinearse con la Especialización Inteligente regional.

Este WP tendrá como objetivo proporcionar planes de acción objetivos para cada uno de los cinco socios de HEI para apoyarlos en el ajuste de sus estrategias y ofertas (con un enfoque especial en la oferta educativa y los procesos de enseñanza / aprendizaje, pero también en investigación y desarrollo (I + D), servicios, etc.) de acuerdo con la especialización inteligente regional / local necesidades y prioridades. Para hacerlo, las estrategias de HEI serán revisadas en base a los resultados del proceso de descubrimiento emprendedor realizado en WP3.

El objetivo principal de este documento es proporcionar 5 planes de acción para cada una de las universidades participantes en el proyecto: Universidade de Trás-os-Montes e Alto Douro (UTAD), Universidad Politécnica de Valencia (UPV), Politécnico de Milán (POLIMI), Newcastle University (NCL) y Uniwersytet Łódzki (ULO).

Cada una de las universidades ha realizado trabajo preliminar dividido en 3 etapas:

- Etapa 1: creación de grupos de trabajo colaborativos con las partes interesadas y talleres de configuración de la mente
- Etapa 2: Mapeo y análisis crítico de las capacidades y oferta de las IES
- Etapa 3: Coincidencia entre las necesidades y prioridades regionales/locales y las capacidades y sugerencias de las IES

Estos planes de acción se basan en los resultados del trabajo preliminar y se centrarán en:

- Evaluar la oferta de las HEIs (en términos de enseñanza y aprendizaje, I+D, servicios, etc.) para ver si concuerda con las estrategias regionales de especialización inteligente;
- Reforzar la cooperación con las autoridades regionales en relación con el crecimiento regional;

- Proporcionar capacitación dentro de las organizaciones hacia las prioridades regionales y áreas de especialización;
- Identificar mecanismos para combinar la excelencia de la investigación con las necesidades y oportunidades regionales.

Una nota final para mencionar que estos planes de acción son una visión general de lo que han hecho las universidades e incluyen algunas recomendaciones que tienen en cuenta ese trabajo que no pretende ser exhaustivo.

2. Action plan: Universidade de Trás-os-Montes e Alto Douro

2. Action plan: Universidade de Trás-os-Montes e Alto Douro

2.1 Context

Universidade de Trás-os-Montes e Alto Douro (UTAD) is an institution oriented towards the creation and dissemination of culture, knowledge and science by merging teaching, scientific research and experimental development. Within the current framework of innovation, the Schools and Research Centres develop scientific activity that seeks to deepen knowledge and develop technology capable of addressing issues of global, national or regional scope. UTAD's core objectives are high quality Teaching, Research and Community Outreach, striving to be a Centre of Excellence for lifelong learning and for the creation, transmission and dissemination of culture, science and technology. UTAD has an International Relations and Mobility Unit (GRIM) that supports students, teachers and staff to go abroad under different mobility programmes and cooperation agreements. The Project Unit (GAP) deals with activities aimed at knowledge transfer, the connection with the business sector and to support companies in the technological area.

UTAD is a member of the recently created “Northern Portugal University Consortium”, in which three major universities (Minho, Porto and UTAD), together with the regional authorities, will elaborate an integrated investment plan for regional development. UTAD also participates in the Iacobus programme (funded by the European Union) which integrates the Galician universities of Vigo, Santiago and Coruña, the Portuguese Catholic University of Porto (UCP), University of Minho (UMinho) as well as with the polytechnic institutes of Porto, Viana do Castelo, Bragança, Cávado and Ave.

UTAD also participates in the joint project (with the municipality of Vila Real and the Portus park network of Science and Technology Parks) of the Regia-Douro Science and Technology Park. This Park focuses on the research and development of wine, vineyard, agricultural, food and environmental technologies. It is constituted by the:

- The Center of Technology and Innovation focusing in applied research and development on Wine and Vineyard (*Centro de Excelência da Vinha e do Vinho* – Center of Excellence of Wine and Vineyard).
- The Douro Business Center providing optimum logistic facilities and networking opportunities for doing business and investing in the Douro region.
- The Douro-NEST incubator and accelerator for tech start-ups, with facilities for young business projects, providing support in business incubation, business acceleration, networking, strategy and internationalisation.

Regarding the smart specialisation and regional development, “Norte 2020” is the financial instrument supporting the regional development of the North of Portugal, managed by Northern Portugal Regional Coordination and Development Commission (CCDR-N). The work carried out during the preparation of the smart specialisation strategy (RIS3) had significant involvement of relevant stakeholders and experts through the organisation of surveys, thematic workshops and individual meetings. After an analysis of the regional context and potential for innovation, and the establishment of an overall vision for North’s future, the following priority areas have been selected for the entire northern region:

- ✓ Life and health sciences
- ✓ Culture, design and fashion
- ✓ Sea-related economic activities
- ✓ Human capital and specialised services
- ✓ Mobility and environment industries
- ✓ Advanced manufacturing
- ✓ Agriculture environmental systems and food
- ✓ Symbolic capital, technology and tourism services

UTAD has played an important role in constructing the relationship with the CCDR-N for the mutual identification of the smart specialisation themes for the RIS3 in the Douro region.

2.2 Gaps, barriers and challenges

The entrepreneurial discovery process done by the UTAD team identified some gaps and challenges of the institutions and its members.

UTAD has a significant portfolio of research projects and strategic partnerships established with the companies in the region with a focus on the agrifood, forestry and tourism sectors as shown in the table below:

Project	Coordinator/partnership	Area
NanoStima	INESC Porto	Sports
Deus Ex Machina	Fraunhofer	Sports
INTERACT-BEST	UTAD/CETRAD	Agro-Chains and Technology
Dourotur	UTAD/CETRAD	Tourism and Development
Plataforma da Inovação da Vinho e do Vinho – Collaborative Lab	UTAD	Wine and Vineyard
Animal Farming – Collaborative Lab	U.Porto and UTAD	Animal Sciences
Smart Farming	UTAD	Farming
UNIRCELL - CQVR	UTAD/PAC	Science
SMARTagrifor	Europeus/UTAD	Agri-forestry
U-BIKE	POSSEUR	transport
REAV2 (Network)	UTAD	Wine and Vineyard
NortelNova	U.Porto, UMinho, UTAD	Technology transfer
Lab2Business	UCP, UTAD	Technology transfer

Table 1 – UTAD projects

Within the framework of CETRAD, UTAD also participates in two projects in the areas of agrobusiness and sustainability and territorial development. On the topic of the local

authorities, there is a strong connection between the university and the municipalities – UTAD has already signed a protocol with 32 municipalities of the region. The Regia-Douro Science and Technology Park has been developing a set of action, namely workshops, in the areas of Tourism, Gastronomy and Wine that attract businesses to the institution.

Despite the synergies with other regions and the enhancement of the collaboration opportunities and participation in networks (as described above), there is still a lack of qualified critical mass and skilled workers. UTAD still needs to work in developing additional cooperation opportunities (through the participation in capacity building programmes and bilateral agreements) to enhance the development of skills and capacity building of its staff and researchers. This would also enhance its participation in international projects which is still in an early stage.

The connection between UTAD and the civil society stakeholders is an aspect that also needs to be improved. There is a weak support for social measures that foster transfer of knowledge and promote integration and social cohesion. This interaction should be improved with more initiatives involving all the stakeholders. Some of the interviewed members from UTAD suggested that this interaction could be improved with the development of an online platform or adaptation of the existing website with information on initiatives and project results, available to all interested stakeholders.

2.3 Concrete actions

The gaps and challenges identified focus on three main areas:

- Training:
 - Better alignment of the academic, staff and research offer at UTAD with RIS3 topics.
 - Increase participation in capacity building programmes.
- Connection with society:
 - Improvement of cooperation mechanisms with civil society, for example, the update of existing platforms such as the Thinking Smart good practices database and toolkit, easily accessible to all interested stakeholders, with information on the projects to be developed and its results.

- Creation of better communication mechanisms between university, businesses/associations and civil society organizations.
- Research and development (R&D):
 - Increase participation in research and development programmes.
 - Better alignment of the research centers at UTAD.

Taking into account these gaps and challenges, SPI defined 4 actions:

1. Invest in training for the technical staff.
2. Invest in more cooperation and exchange programmes.
3. Improve cooperation mechanisms between UTAD and the civil society.
4. Reinforce support structures for R&D.

Action 1.

Invest in training for the technical staff

OBJECTIVE:

Develop UTAD's educational and training offer initiatives for its technical staff that is ill-equipped to understand the RIS3 and how UTAD can expand its services in societal engagement, cooperation, participation in EU-funded programmes, and research and development.

ACTIVITIES TO DEVELOP:

- : Organize a meeting with the different departments to understand the main needs of the technical staff.
- : Restructure the existing training offer to address those needs.
- : Provide the means for the technical staff to attend those short courses.

Action 2.

Invest in more cooperation and exchange programmes

OBJECTIVE:

Expand and improve the two units that support these activities: GAP (Projects Unit) and GRIM (International Relations and Mobility Unit). There is already a strong involvement in Erasmus + and H2020 programmes, as well as other cross-border exchange programmes with universities from the North of Portugal and Galicia. Nevertheless, these actions should be further increased.

ACTIVITIES TO DEVELOP:

- : Establishment of additional protocols with international institutions focused on similar thematic areas for the mobility of students, researchers and staff.
- : Development of applications for national (Norte 2020) and international (Marie-Curie and H2020) programmes with the objective to support doctorate and post-doctorate researchers.

Action 3.

Improve cooperation mechanisms between UTAD and the civil society

OBJECTIVE:

Develop stronger links with the civil society, i.e, better communicate the initiatives that are taking place.

ACTIVITIES TO DEVELOP:

- : Involve civil society organizations in the different project's dissemination activities.
- : Use of the Thinking Smart platforms (best practices database and toolkit) that will be available in English and Portuguese to disseminate information on the projects

and its results to all interested stakeholders. These platforms can be updated and linked to existing platforms at UTAD, for example, the Wine Innovation Platform hosted by Regia-Douro Parque.

- : Create mailing lists to disseminate information.

Action 4.

Reinforce support structures for R&D

OBJECTIVE:

Increase cooperation between its different units as a way of reinforcing R&D activities and strengthen the funding from partnership projects. This will also benefit the strengthening of cooperation with external entities (see Action 2.)

ACTIVITIES TO DEVELOP:

- : Creation of a working group (with one representative from each department and the GRIM and the GAP units) that will host regular meetings to define lines of actions and next steps. These meetings could also be attended by external entities (if considered relevant).
- : Development of a joint activity plan by the working group. This plan will define actions, responsibilities and indicators functioning as an action plan and monitoring guide. Examples of actions could be the update of the platform (see action 3) with the existing projects and organization of a joint UTAD research day.

3. Action plan: Universitat Politecnica de Valencia

3. Plan de Acción: Universitat Politècnica de Valencia

3.1 Contexto

La Universitat Politècnica de València (UPV) fue fundada a principios de los 70 y ahora está compuesta por 10 escuelas, 3 facultades, 2 escuelas politécnicas superiores y escuelas asociadas (Escuela Técnica de Ingeniería Industrial Ford España, Facultad de Ciencias Empresariales, Escuela Universitaria La Florida y Pax University College). Las 10 escuelas y facultades están distribuidas en tres campus: Vera, Alcoy y Gandia. El Campus Vera tiene la mayoría de las facultades, incluyendo la Facultad de Administración y Dirección de Empresas, la Facultad de Bellas Artes, la Escuela de Ingeniería Agrícola y Medio Ambiente, la Escuela de Arquitectura, la Escuela de Ingeniería de Edificación, la Escuela de Ingeniería Civil, la Escuela de Ingeniería de Diseño, la Escuela de Ingeniería en Geodesia, Cartografía y Topografía, la Escuela de Ingeniería Industrial, la Escuela de Informática, la Escuela de Ingeniería de Telecomunicaciones y la Escuela de Doctorado. La UPV tiene casi 38.000 estudiantes, 2.600 miembros del personal docente e investigador y 1.700 personal administrativo y de servicios.

Como se describe en su sitio web, la misión de la UPV es:

- ofrecer una formación estructurada de calidad orientada a las necesidades de la sociedad;
- desarrollar investigaciones que sean relevantes y tengan un impacto;
- transferir sus resultados tanto a nivel nacional como internacional;
- ser considerado como un socio estratégico para universidades e instituciones a nivel global;
- destacarse en su compromiso con la responsabilidad social como universidad pública.

El Institut Valencià de Competitivitat Empresarial (IVACE) es la agencia responsable de RIS3 en la Comunidad Valenciana. IVACE tiene como objetivos establecer, gestionar y respaldar

empresas valencianas que desean modernizarse e internacionalizarse, y también apoya la creación de nuevas empresas. También promueve, gestiona y coordina las infraestructuras industriales, las instituciones de investigación, desarrollo e innovación, los parques científicos y tecnológicos.

El RIS3 valenciano se desarrolló teniendo en cuenta un análisis del contexto regional y el marco estratégico establecido. Se centró en siete grupos de trabajo: agroalimentario, consumo (pero no hábitat), tecnologías facilitadoras clave (KET), tecnologías de la información y la comunicación (TIC), economía baja en carbono (LBC), logística y transporte.

De ellos, el RIS3 fue delimitado en tres ejes:

- Eje 1: Calidad de vida
 - Productos agrícolas, cosméticos y domésticos
 - Promoción de la salud y asistencia sanitaria pública eficiente
 - Turismo y calidad de vida
- Eje 2: Producto innovador
 - Bienes de consumo personalizados
 - Hábitat: la vivienda y su entorno
- Eje 3. Procesos de fabricación avanzados
 - Automatización y movilidad
 - Bienes de equipo

Tal como se presenta en mayor detalle en WP3 por la UPV, estos grandes ejes económicos regionales han sido analizados desde la perspectiva de posibles áreas de especialización tecnológica o transversal. Estas áreas de experiencia se han reorganizado en las siguientes áreas:

- Materiales avanzados y nanotecnología
- Fabricación avanzada
- TIC (Tecnologías de la información y la comunicación)
- Biotecnología

- Micro y nanoelectrónica, y fotónica
- Energía y tecnologías ambientales
- Logística

3.2 Brechas, barreras y desafíos

La UPV tiene una participación muy fuerte en proyectos europeos de investigación e innovación (I + I) y participa en más de 70 proyectos H2020. Por lo tanto, hay solicitudes sistemáticas a su comunidad para participar en las actividades del proyecto. Debido a este hecho, sería más difícil reclutar interesados para las actividades de Thinking Smart.

Para resolver este desafío, la UPV adoptó un enfoque diferente al adoptar un formato de talleres y grupos de mentalización que alentaron el debate a las preguntas planteadas.

Estos participantes señalaron varios aspectos que han estado mejorando, así como las lagunas y barreras para la implementación exitosa de RIS3.:

- La conexión entre las universidades y las industrias ha mejorado significativamente, sin embargo, todavía hay una falta de mecanismos de confianza y comunicación más efectivos. De hecho, debe haber una optimización de esta conexión, por ejemplo, a través de la mejora de los mecanismos de comunicación como el hecho en la iniciativa Ask UPV.
- Algunos investigadores entienden que la universidad no puede hacer mucho más en RIS3 que lo que ya se hizo, ya que la cultura académica no puede abordar todas las prioridades multidisciplinares y temáticas. La investigación (a través de la publicación de artículos académicos es de suma importancia) y los académicos tardan más tiempo en adaptarse a estos cambios; esto se puede cambiar con más políticas e incentivos hacia este aspecto, por ejemplo, el desarrollo de más patentes y no solo clasificación y acreditaciones.
- Las universidades no tienen mucha experiencia con los Fondos Estructurales de la UE.
- La Comunidad Valenciana tiene ahora mayores niveles de productividad, a pesar de estar fuertemente afectada por la crisis financiera y económica de 2008. Sin embargo,

la industria todavía tiene poca especialización en productos de alta tecnología y es altamente sensible al ciclo económico, altamente dependiente del turismo. Valencia también tiene escasez de grandes empresas. Hay un bajo gasto en I + D y pocas empresas tienen empleados con formación científica y conocimiento sobre las oportunidades de I + I de la UE.

3.3 Acciones concretas

Las lagunas y los desafíos identificados se centraron principalmente en las universidades, cómo pueden hacer más en RIS3 y en la industria, cómo aumentar su gasto e inversión en I + I. Además, también es importante invertir más en una conexión optimizada entre universidades e industrias.

A continuación se detallan 4 acciones para abordar estos problemas:

1. Invierta en una cooperación más estrecha entre universidades e industrias a través de estancias de intercambio.
2. Mejorar los mecanismos de comunicación entre la UPV y la industria.
3. Proporcionar capacitación tanto para las empresas como para el personal de la universidad.
4. Reforzar las estructuras de soporte para el desarrollo de patentes.

Acción 1.

Invierta en una cooperación más estrecha entre universidades e industrias a través de estancias de intercambio.

OBJETIVO:

Las estancias cortas de profesores universitarios y o investigadores en empresas serían muy útiles para desarrollar una investigación conjunta alineada con las necesidades de las empresas y los intereses de investigación. De esta forma, las universidades estarían más involucradas en las aplicaciones prácticas de su investigación y las empresas verían los

beneficios de invertir en más capacitación en I+D

ACTIVIDADES A DESARROLLAR:

- : Creación de un comité de reclutamiento y selección
- : Desarrollo de un grupo de empresas e investigadores interesados en participar en la iniciativa sobre la base de un conjunto de criterios, incluidos los intereses y la disponibilidad
- : Definición del programa de trabajo, objetivos y duración de la estancia entre el investigador / profesor seleccionado y la empresa
- : Definición de los resultados que se lograrán durante y después de la estancia

Acción 2.

Mejorar los mecanismos de comunicación entre la UPV y la industria

OBJETIVO:

Las universidades y la industria están cooperando, pero los mecanismos de comunicación aún son débiles. Para mejorar esto, es necesario crear más iniciativas que les permitan trabajar más de cerca.

ACTIVIDADES A DESARROLLAR:

- : Organización de eventos anuales "La ciencia se encuentra con los negocios" donde los investigadores pueden presentar su trabajo y actividades y las empresas pueden explorar formas de integrar la I + I en su trabajo
- : Creación o mejora de canales de comunicación como Ask UPV con plataformas en línea para realizar solicitudes específicas

Acción 3.

Proporcionar capacitación tanto para empresas como para el personal de la universidad

OBJETIVO:

El personal de las empresas en la región tiene poca capacitación científica y no está tan consciente de las oportunidades de I+D. El personal de las universidades tiene poco conocimiento de los Fondos Estructurales de la UE. Estos dos aspectos se pueden abordar con la provisión de capacitación para ambos.

ACTIVIDADES A DESARROLLAR:

- : Desarrollar sesiones de capacitación cortas (en línea y cara a cara) para las empresas que se pueden incluir en su programa de capacitación sobre cómo la gestión de I+D
- : Promover sesiones de formación para el personal de las universidades sobre cómo comprender mejor los Fondos Estructurales de la UE
- : Desarrollar hojas informativas cortas/guías con información sobre los Fondos

4. Action plan: Politecnico di Milano

4. Action plan: Politecnico di Milano

4.1 Context

The Politecnico di Milano (POLIMI) is a scientific and technological university aimed to train engineers, architects, planners and industrial designers. It has seven campus – Milano (Leonardo and Bovisa campuses), Como, Lecco, Cremona, Mantova and Piacenza – with over 1200 technical administrative staff, 1364 teaching staff and almost 43000 students.

POLIMI has 12 departments:

- Aerospace Science and Technology
- Architecture and Urban Studies
- Architecture, Built Environment and Construction Engineering
- Chemistry, Materials and Chemical Engineering
- Civil and Environmental Engineering
- Design
- Electronics, Information and Bioengineering
- Energy
- Management, Economics and Industrial Engineering
- Mathematics
- Mechanical Engineering
- Physics

It also has other research infrastructures such as the WindTunnel, PoliFab, Polifactory, and Materials Testing Laboratories, more than 250 labs, and a Joint Research Centre. POLIMI also participates in the clusters of Design of health facilities, Innovative Textiles and Security, Safety, Defense and Disaster Management.

POLIMI has a vast experience in EU funded research projects: 272 projects + 9 ERC Grants (FP7) and 208 H2020 projects. Data from 2016 show that 48 companies were established and accredited since 2000 and that 1396 patents were filed.

POLIMI and the city and regional institutions, namely the Regional Council of Lombardy that is responsible for the RIS3 - made a joint effort to create an institution – Fondazione Politecnico – to strengthen the alliance between university and the industry. Fondazione was launched in 2003 with the mission to “build a more effective relationship between university, industry and public administrations”. Fondazione develops innovation and European projects for large companies and SMEs. It also develops training programmes for professionals.

POLIMI is part of the Lombardy region which was one of the first to launch its smart specialization strategy in 2013. The development of the strategy was done by several actors, in which POLIMI and other regional Higher Education Institutions were included. The economic complex profile of the region, which is highly specialized and differentiated led to the definition of eight priority, as follows:

- Aerospace
- Agri-food
- Green industry
- Creative and cultural industries
- Health industries
- Advanced manufacturing
- Sustainable mobility
- Smart Cities (cross cutting priority)

These priorities are combined with the areas of the Regional Technological Clusters¹ (Aerospace, Agri-food, Green chemistry, Energy, Life sciences, Technologies for living environments, Smart factory, Mobility, and Technologies for Smart Communities) as a way to enhance the development of a multi-sectorial system.

¹ “The Region aims at supporting a process of identification of new emerging manufacturing systems, at the same at promoting new capacity of collaboration between the regional actors. Technological clusters (TC) are identified in this sense as both a space for supporting entrepreneurs developing new cross-sectorial fields of innovations and new governance spaces - to connect regional authorities and regional systems”

4.2 Gaps, barriers and challenges

As mentioned in the previous section, the Lombardy region is different from the other regions partner of the Thinking Smart project as it is highly specialized and differentiated. POLIMI has played a very important role in the definition of the Lombardy RIS3 (see 3.1), which due to its complexity also involved several different departments spanning many of the RIS3 priorities.

In fact, the connection between POLIMI and the regional institutions in Lombardy is good, but done mainly through the different departments rather than centrally. This is not a concern for the departments, as it is seen as a more effective way of cooperating. Nevertheless, it should be ensured that more cooperation mechanisms are defined for the departments.

Despite the importance of POLIMI as an actor in the development of the Lombardy smart specialization strategy, the participants are concerned that higher education institutions in general should be more involved as practical actors in the actual implementation of the RIS3, namely in the implementation of R&D results in the industry, and not solely as providers of theoretical inputs.

There is also a concern that in the last phase of the policy implementation of RIS3 the interaction between the different actors – namely HEIs and Regional Technological Clusters – is not monitored effectively and, therefore, it does not have a measurable impact.

POLIMI has been enhancing the establishment of collaboration with industry, not only through the work of the Fondazione, but also through the networks established (for example, with several consortia in the different fields). POLIMI is also a major actor in the development of and participation in EU funded initiatives (see 2.1), nevertheless, there is a feeling among the departments that results and activities are not being efficiently disseminated, thus possibly reducing its impact on several levels.

Some of the most active departments of POLIMI expressed a sense of conformity towards these issues which may, in some way, hinder the adaptation to the challenges and the development of the actions to solve them.

4.3 Concrete actions

Taking into account the information collected by POLIMI in their WP3 activities, the following actions are proposed:

1. Invest more in the communication and cooperation between departments and regional authorities
2. Monitor the actual impact and implementation of the RIS3
3. Disseminate and advertise the ongoing initiatives (and success stories)

Action 1.

Invest more in the communication and cooperation between departments and regional authorities

OBJECTIVE:

The different departments at POLIMI have a good degree of communication and interaction with the regional authorities and other actors of the RIS3 in Lombardia. To leverage these connections, more investment should be made on this.

ACTIVITIES TO DEVELOP:

- : Create a task force between departments to define strategies for a closer interaction (see action point 2 and 3)

Action 2.

Monitor the actual impact and implementation of the RIS3

OBJECTIVE:

This monitoring can be done at the POLIMI departmental level by the Heads of Department, but with an involvement of the central level. If a close monitoring with

specific key performance indicators are established by the departments, it will be easier to actually measure the impact of the implementation of the RIS3.

ACTIVITIES TO DEVELOP:

- : Promote department meetings to define the monitoring strategy, namely the objectives and the key performance indicators to be achieved
- : Promote inter-departmental meetings to share and discuss the monitoring strategy
- : Combine the monitoring strategy with the results of action 3

Action 3.

Disseminate and advertise the ongoing initiatives (and success stories)

OBJECTIVE:

POLIMI has a vast track record of participation in EU funded programmes (FP7 and H2020). It also has a strong connection with companies in the Lombardy region. However, the dissemination and advertising of the ongoing initiatives (as well as success and failure stories) are not so effective.

ACTIVITIES TO DEVELOP:

- : Create a specific section on the POLIMI website to disseminate these results and initiatives
- : Include these news in the newsletters, social media and other promotional materials to be disseminated

5. Action plan: Newcastle University

5. Action plan: Newcastle University

5.1 Context

Newcastle University (NCL) is a research intensive university in the North East of England whose roots can be traced back to 1834 with the establishment of the School of Medicine and Surgery. Newcastle’s main teaching and research activities take place at the Newcastle city centre campus. NCL has three further campuses in Singapore, Malaysia and London.

Newcastle University is organised around three faculties - the Faculty of Humanities and Social Sciences, the Faculty of Medical Sciences and the Faculty of Science, Agriculture and Engineering.

It has as main objectives to:

- be a world-class research-intensive University
- deliver teaching and facilitate learning of the highest quality
- play a leading role in the economic, social and cultural development of the North East of England

The North East Local Enterprise Partnership (North East LEP) is a public, private and education sector partnership. It is one of the 38 LEPs in the United Kingdom and is responsible for promoting and developing economic growth in the local authority areas of County Durham, Gateshead, Newcastle, North Tyneside, Northumberland, South Tyneside and Sunderland, focusing specifically on:

- Innovation
- Business growth and access to finance
- Skills
- Employability and inclusion
- Economic assets and infrastructure
- Transport and connectivity

The LEPS have a central role in delivering the RIS3 by identifying opportunities at the local level that could be aligned with national research/innovation and industrial priorities. The NELEP embraced this role within smart specialisation. NELEP commissioned a smart specialisation report (prepared in-part by members of Newcastle University) that was published in December 2013. The analysis in the report focused on four areas of economic activity in which the North East had existing strengths or strong potential for growth:

- Passenger Vehicle Manufacturing;
- Subsea and Offshore Technology;
- Life Sciences and Healthcare; and
- Creative, Digital, Software and Technology Based Services.

These four areas have subsequently been adopted and promoted as smart specialisation priorities by NELEP.

Newcastle University made a significant contribution to the identification of the region's research and knowledge strengths as part of the RIS3 development process through their input into the 2013 analytical report for NELEP.

5.2 Gaps, barriers and challenges

The RIS3 was developed by NELEP in coordination with Newcastle University researchers (see 5.1), however, this was only to provide analytical and theoretical inputs. In this regard, Newcastle University was not directly involved in the actual development of the RIS3.

Another gap is that NCL has not been actively implementing the RIS3: there is some alignment between the priority areas in RIS3 and the strategic research strengths of Newcastle University, but this is mainly because these are based on existing research and innovation strengths. This fact suggests a lack of awareness and, maybe even, interest in the RIS3 developed, maybe also due to the lack of direct involvement of the university.

The region has some challenges to tackle, namely:

- Insufficient capacity of its workers
- Asymmetrical information for businesses

- Low productivity
- External competition
- Limited number of actors (only one science park (in Durham rather than Newcastle) and only a handful of business incubators and accelerators (some still emerging))

These factors show a lack of capacity of the region in becoming a more knowledge-based economy and, thus, turning R&D results into concrete solutions for the market. Of course, there are examples of innovation activities in the region, however, these are not widely disseminated throughout the region and to all actors.

The participants of the WP3 activities in Newcastle also mentioned that the lack of regional political autonomy has a negative effect. It was also pointed that the structure of NCL as highly decentralised hinders not only the collaboration and communication between the regional authorities and university, but also limits the management and monitoring of the work of the different departments towards RIS3.

The need for better monitoring of the regional economy that could be used to inform policy on an ongoing basis and the promotion of innovation success stories were also pointed as gaps by the participants.

5.3 Concrete actions

There are a number of challenges related with lack of communication, monitoring and lack of capacity of industry that can be improved through the adoption of some actions:

1. Monitoring of NCL actions towards RIS3 implementation
2. Closer communication between the NELEP and NCL departments
3. Dissemination of ongoing initiatives
4. Training for companies/ NCL's alignment with RIS3

Action 1.

Monitoring of NCL actions towards RIS3 implementation

OBJECTIVE:

As NCL is a large university where the departments have autonomy, fragmentation is a reality and, therefore, it is more difficult to monitor what is being done by NCL's staff towards the RIS3 implementation.

ACTIVITIES TO DEVELOP:

- : Create a working group between all departments with a managing team
- : Define a monitoring strategy (taking into account the research needs and interests and the RIS3 priorities) with key performance indicators, objectives and expected outputs
- : Meet regularly to monitor the results and discuss them (also linked to action 2)

Action 2.

Closer communication between the NELEP and NCL departments

OBJECTIVE:

This action point is closely related with action 1 as the lack of communication would also be improved by the creation of a single contact point – in this case, the working group foreseen for monitoring purposes.

ACTIVITIES TO DEVELOP:

- : Define what are the weak points in the communication and how to improve them
- : Use the working group meetings to redefine strategies

Action 3.

Dissemination of ongoing initiatives

OBJECTIVE:

This action is also combined with the 2 previous ones (action point 1 and action point 2) as the decentralized structure does not help the dissemination of the existing initiatives for all the regional actors

ACTIVITIES TO DEVELOP:

- : Creation of a specific section on the website with information on ongoing initiatives and their results
- : Use of promotional materials and social media to disseminate information
- : Promote science-business events where regional initiatives can also be promoted

Action 4.

Training for companies/ NCL's alignment with RIS3

OBJECTIVE:

The funding by businesses of professorships within universities was discussed during the workshop as a possible way of bringing research carried out in universities closer to industry needs. "Professor of Practice" is an idea already used by NCL for visiting professors with a background outside of academia. This could be adapted for the RIS3 priority areas as a way to strengthen the alignment of NCL research with the RIS3. These Professors of Practice could also provide short training programmes for companies on how to better implement R&D inputs in the companies' work.

ACTIVITIES TO DEVELOP:

- : Analysis by the relevant departments at the university and with the companies how to adapt and integrate the “Professor of Practice” to the companies’ needs.

6. Action plan: Uniwersytet Łódzki

6. Action plan: Uniwersytet Łódzki

6.1 Context

The Uniwersytet Łódzki – University of Lodz (UL) was established in 1945 and is composed by 12 faculties, with programmes in 90 fields of study, 160 specializations, 50 postgraduate study programmes, and 7 doctoral programmes. More than 32 000 students attend the 12 faculties: Faculty of Biology and Environmental Protection, Chemistry, Economics and Sociology, Educational Sciences, International and Political Studies, Law and Administration, Management, Mathematics and Computer Science, Philology, Philosophy, History, and Physics and Applied Informatics.

The University of Lodz participated actively in the development of the Regional Innovation Strategy for the Lodzkie Region LORIS 2030, a process set-up in 2012 by the Marshall Office of the Lodzkie Region aimed at preparation of the renewed RIS3 strategy approach. The RIS3 of the Lodzkie region was developed through a task force with representatives of enterprises, scientific units (vice-rectors, scientific researchers), Technology Transfer Centres and administration authorities. The support was mainly to provide research and analytical inputs.

The process finished in early 2013, and after regional consultations the Strategy was officially adopted as binding document by the Regional Parliament (Sejmik) in May 2013. The main assumptions of the strategy have addressed the areas of 6 smart specialization, described below²:

Priority areas	Description
Modern Textile and Fashion Industry incl. design	Innovative solutions (technologies) in the area of raw materials acquisition for the textile industry (natural and synthetic);

² Information taken from the S3 platform: http://s3platform.jrc.ec.europa.eu/documents/20182/231100/PL_Lodzkie_RIS3_Final.pdf/b00be20f-14a8-40eb-a180-c21b27e70dfa

	<p>Innovative products and technologies in the area of technical textile products; technologies and textual materials; personalization of textile industry products; production process optimization in the textile industry; IT tools supporting design, production and sales of textile industry products.</p>
<p>Advanced building materials (including design)</p>	<p>Acquisition and processing of natural mineral resources using innovative technologies for the production of construction materials with energy-saving and special properties, reuse of materials and use of waste, materials with improved thermal insulation, sound absorption, fire resistance or energy (including RES) properties; innovative wood materials with new functional properties; biopolymers, biocomposites and biologically inspired technologies; polymer materials; innovative use of mobile and control technologies in mineral extraction, processing, building materials manufacturing and smart construction; smart, integrated urban infrastructure management systems; intelligent building technologies and intelligent building project management software, including Building Information Modeling (BIM) technologies; Innovative application of functional technologies of multilayer textile materials - composite</p>

	<p>materials in construction to strengthen existing buildings of construction infrastructure and to perform new buildings using modern composite materials; Innovative applications of materials with shape memory (alloy) in construction.</p>
<p>Medical Industry, Pharmaceuticals and Cosmetics incl. health resort medicine</p>	<p>Innovative technologies for the manufacture of biotechnological medicines and generic products; innovative solutions for personalised medicine; development of new substances and materials for use in medicine, pharmacy and cosmetics; Innovative solutions for information technology tools for healthcare systems, pharmaceuticals and cosmetics; innovative solutions for optimization of manufacturing processes in the pharmaceutical, cosmetic and medical device manufacturing industries; solutions for process and organizational innovations in health care management, including the transfer of products and services to clinical practice;</p>
<p>Power generation (including Renewable Energy Sources)</p>	<p>Energy infrastructure solutions - smart grids; energy infrastructure management and control systems; IT tools to support management and decision support processes; innovative technologies to increase the efficiency of acquisition and use of alternative energy sources; in the field of energy efficiency improvement, and in particular - energy storage; concerning the</p>

	<p>use of renewable sources; enabling the development of distributed energy; concerning energy security; related to the reuse of waste, products and extraction sites; related to the activity of the consumer (prosumer energy).</p>
<p>Innovative agriculture and food processing</p>	<p>Creative breeding of plants and fungi of higher utility value; innovative fertilizers, biological preparations with dedicated application and controlled release and innovative biologically active substances for the production of plant protection products; rationalisation of water and energy management in agricultural production and reduction of negative impact on the environment; innovative technologies of cultivation and fertilisation of plants preventing degradation and improving soil quality, including the restoration of degraded soils and the protection of agricultural land; intelligent systems of monitoring, control and diagnostics in agriculture; innovative production of functional food, dedicated to various social groups and low-naturally processed food, based on product specialisation; food quality assessment systems and innovative technologies/systems that enable high quality food to be maintained during storage and processing (intelligent preservation and storage systems, biodegradable and</p>

	<p>functional packaging that protects quality, prolongs the shelf life of food products and enhances food safety); innovative food chain management systems; innovative technologies of cultivation and fertilisation of plants preventing soil degradation and improving soil quality, including reclamation of degraded soils and protection of agricultural land; extraction and processing of bioactive compounds and other raw materials from plant (including waste biomass) and animal materials, coming from the agri-food sector, intended for various branches of industry, including biofuels and other energy products, fibres from natural and processed raw materials, food supplements, medicines and cosmetics; innovative technologies in plant production, storage and agri-food processing, including intelligent and energy-efficient machinery and robotised workstations; innovative systems to ensure the achievement of hygiene standards and to secure equipment in agriculture, the agri-food industry; innovative technologies for renewable energy production and energy consumption management systems.</p>
<p>Computer science and telecommunication</p>	<p>Innovative software for intelligent cities and buildings, energy and transport networks (based on sensor networks); innovative applications of artificial intelligence in</p>

	<p>analytics, computing, robotics and games; intelligent bioinformatics and pharmacoinformatics applications in medicine, agriculture and animal breeding, as well as pharmaceutical and medical research; Innovative use of information technology in telemedicine and personalised medicine; advanced modelling of complex structures and simulations as well as analysis and optimisation of advanced structures (including aeronautical structures); intelligent ICT systems for optimisation of production, logistics and supply chain processes (m.); intelligent Internet technologies, including semantic technologies and the Internet of Things; intelligent applications of geoinformatics and satellite navigation systems; intelligent data management systems in networks, including cloud computing; innovative multimedia and games; Intelligent solutions for data and information security.</p>
--	---

Table 2 – RIS3 priority areas in Lodzkie region

6.2 Gaps, barriers and challenges

The participants in WP3 activities pointed out several challenges to the RIS3 implementation in the Lodzkie region and, especially in the University.

In fact, the University of Lodz is yet in the process of developing a strategy for the implementation of RIS3 in its activities. Bureaucracy and low capacity of flexibility are one of the reasons for the slow adoption of new strategies. In addition, the cooperation between

science and business is quite low and there are no support instruments for cooperation between scientific, academic and economic institutions. The research developed by the University of Lodz has little or no commercial and practical effect for the companies in the region and there is also little opportunities for internships and research stays for students and researchers in the companies.

Another problem linked to this is the lack of knowledge from both science institutions and companies about intellectual property rights and patents, which hinders the cooperation opportunities even further. There is also lack of knowledge of scientific and technical capacity in the process of commercialization of technology. As a consequence, but also due to its characteristics, the local market has limited absorption of innovative products.

These facts results in insufficient trust and understanding between science and business, prevailing the insufficient willingness to cooperate. The lack of cooperation between entrepreneurs and research centers in Lodzkie region weakens the potential for more innovation and bigger research projects, narrowing to regional and, sometimes, national activities.

Lastly, there is a strong dependence on EU funds, which is definitely a barrier to further sustainable development of the region and its institutions in the different sectors.

6.3 Concrete actions

The information provided on section 6.1 and 6.2 on the context of the University of Lodz, the Lodzkie region RIS3 and the challenges and barriers for its implementation show some points that can be further improved.

The main problem is the lack of knowledge on how to establish cooperation between science and business. This can be improved by providing training to both companies and the researchers at Lodzkie region on aspects such as intellectual property rights and science management.

Another problem is the lack of trust between the two sectors, which can be diminished through cooperation activities.

The 4 actions suggested below can further support these needs:

1. Provide training for researchers on intellectual property rights, science management, and commercial approach to research.
2. Provide training for companies on intellectual property rights and commercial approach to research.
3. Promote sessions to explore how to get funding outside the EU programmes.
4. Create initiatives for the promotion of links between science and business, such as working groups and Science meets Business events.

Action 1.

Provide training for researchers on intellectual property rights, science management, and commercial approach to research.

OBJECTIVE:

Researchers at the University of Lodz need additional training on specific aspects of applicability of science research to the market, namely intellectual property rights, how to manage science research and how to interact with companies, as well as how to better align research with commercial needs.

ACTIVITIES TO DEVELOP:

- : Disseminate a survey to researchers to understand their actual needs
- : Define training sessions taking into account the needs of the researchers
- : Include the training sessions in the training programme of the University of Lodz
- : Monitor results and impact

Action 2.

Provide training for companies on intellectual property rights, and commercial approach to research.

OBJECTIVE:

The staff of the companies of the Lodzkie region need additional training on how to innovate in their activities and products and how to interact with the science institutions to leverage on the commercial use of the existing research done locally.

ACTIVITIES TO DEVELOP:

- : Collect the needs of the staff to adjust the training offer
- : Include the training sessions in the training programme of the companies
- : Evaluate the impact and if any changes are needed

Action 3.

Promote sessions to explore how to get funding outside the EU programmes.

OBJECTIVE:

As the region is much dependent on EU funding, it is important to learn more about additional opportunities outside the EU programmes, investment, and other sources of funding. These sessions are important for all the actors involved (directly or indirectly) with the RIS3 implementation.

ACTIVITIES TO DEVELOP:

- : Define programmes for these short sessions (that can be included in the agenda of bigger events) – see action 4

- : Disseminate it to the different actors – university members, companies, established and potential entrepreneurs

Action 4.

Create initiatives for the promotion of links between science and business, such as working groups and Science meets Business events.

OBJECTIVE:

These initiatives are a first step for the promotion of cooperation between science and business as a way to understand how they can work together and increase trust, which is the main issue of the lack of interactions.

ACTIVITIES TO DEVELOP:

- : Creation of a working group with representatives from the University of Lodz, the industrial chambers/parks, selected companies and the regional authority responsible for the implementation of the RIS3 initiative
- : Promotion of annual events such as Science meets Business where researchers can present the work developed. In these events there could also be parallel sessions on investment, commercialization of products and others (see action 2 and 3)

7. Conclusions

7. Conclusions

Las 5 universidades incluidas en este documento - Universidade de Trás-os-Montes e Alto Douro, Universidad Politécnica de Valencia, Politécnico de Milán, Universidad de Newcastle y Universidad de Lodz - así como las regiones en las que se insertan tienen niveles muy diferentes de desarrollo, autonomía y especialización. Las interacciones entre las universidades y las autoridades regionales también son bastante diferentes de una región a otra.

Siendo así, estos hechos han llevado a conclusiones y sugerencias diferentes, descritas en las secciones anteriores, sin embargo, es interesante observar que también hay algunos puntos comparables, a saber:

- Se podría mejorar la comunicación de las actividades y los resultados de las actividades de investigación e innovación de las universidades al público en general y entre los departamentos.
- Existe una falta de conocimiento entre las empresas y las universidades sobre cómo interactuar mejor para implementar realmente los resultados de investigación e innovación realizados en las universidades.
- Los resultados de monitoreo de RIS3 no siempre se comunican y no son de fácil acceso.

También vale la pena mencionar que algunas regiones y universidades se encuentran en un proceso de reestructuración, a saber, el NELEP en la región de Newcastle. Como el proceso está ocurriendo actualmente, no fue posible integrar estos cambios en el documento debido a la línea de tiempo del proyecto.
